

This project was for the design-build construction of a new 90,000 square foot, 3-story building for the San Francisco Police Department's Traffic Control Division and Forensic Services. The new facility features administrative, conference, and office spaces, labs, a firearm testing facility, motorcycle parking, and a generator with a 7,000-gallon belly tank. The building is constructed to withstand and remain operational through a major earthquake. Rosendin's scope of work included all electrical, communications, audio-visual, security, and fire alarm systems.
